G a countable group, μ a probability measure on G.

A function $f : G \to \mathbb{R}$ is called μ-harmonic if $f(g) = \sum_{h \in G} f(gh)\mu(h)$ for all $g \in G$.

$$H^\infty(G, \mu) := \{f : G \to \mathbb{R} \mid f \text{ bounded and } \mu\text{-harmonic}\}$$

The Poisson boundary (B, ν) of (G, μ) is a probability space endowed with a G-action such that $\nu = \mu * \nu$ (i.e., ν is μ-stationary) and

$$H^\infty(G, \mu) \cong L^\infty(B, \nu).$$

Example 1: $G = F_2$ **the free group of rank** 2**.**

For any (non-degenerate) $\mu \in \mathrm{Prob}(F_2)$ there is a unique μ-stationary prob. measure ν on ∂F_2.

If $H(\mu) = -\sum_{g \in F_2} \mu(g) \log \mu(g) < \infty$, then $(\partial F_2, \nu)$ is the Poisson boundary of (G, μ). [Dynkin-Maljutov '61, Derriennic '75, Ancona '87, Kaimanovich '94, Chawla-Forghani-Frisch-Tiozzo '22]

(true more generally for hyperbolic groups)

Example 2: $G = \mathbb{Z}/2\mathbb{Z} \wr B$ the wreath product with $\mathbb{Z}/2\mathbb{Z}$ lamps and base group B.

$$\mathbb{Z}/2\mathbb{Z} \wr B := \bigoplus_B \mathbb{Z}/2\mathbb{Z} \rtimes B.$$

where $\bigoplus_B \mathbb{Z}/2\mathbb{Z} = \{f : B \to \mathbb{Z}/2\mathbb{Z} \mid f \text{ with finite support}\}$ and B acts on $f \in \bigoplus_B \mathbb{Z}/2\mathbb{Z}$ by:

$$(b \cdot f)(x) = f(b^{-1}x), \ x, b \in B.$$

Lamplighter interpretation

Multiplying an element (f, x) on the right by elements of $\mathbb{Z}/2\mathbb{Z}$ changes the lamp configuration f at the current position x, while multiplying by elements of B changes said current position.

Examples of Poisson boundaries

Example 2: $G = \mathbb{Z}/2\mathbb{Z} \wr B$ **the wreath product with** $\mathbb{Z}/2\mathbb{Z}$ **lamps and base group** B**.**

$$\mathbb{Z}/2\mathbb{Z} \wr B := \bigoplus_B \mathbb{Z}/2\mathbb{Z} \rtimes B.$$

Consider $\mu \in \mathrm{Prob}(\mathbb{Z}/2\mathbb{Z} \wr B)$ non-degenerate with $H(\mu) < \infty$.

Kaimanovich-Vershik '83, Erschler '04: the Poisson boundary of $(\mathbb{Z}/2\mathbb{Z} \wr B, \mu)$ is non-trivial if and only if the projection to B is transient.

Under general hypotheses on μ (e.g., a finite first moment), there is a μ-stationary prob. measure ν on $\prod_B \mathbb{Z}/2\mathbb{Z}$ such that $(\prod_B \mathbb{Z}/2\mathbb{Z}, \nu)$ is the Poisson boundary of $(\mathbb{Z}/2\mathbb{Z} \wr B, \mu)$. [Kaimanovich '00, Erschler '11, Lyons-Peres '21, Frisch-S. '24]

⚠ In general there will be multiple μ-stationary measures (e.g., if B is amenable).

Entropy

Consider G a countable group and $\mu \in \mathrm{Prob}(G)$ non-degenerate with $H(\mu) = -\sum_{g \in G} \mu(g) \log \mu(g) < \infty$.

The asymptotic entropy of (G, μ) is defined as

$$h(\mu) := \lim_{n \to \infty} \frac{H(\mu^{*n})}{n}.$$

The entropy criterion [Avez '72, Derriennic '81, Kaimanovich-Vershik '83]

The Poisson boundary of (G, μ) is non-trivial $\iff h(\mu) > 0$.

Consider G a countable group and $\mu \in \mathrm{Prob}(G)$ non-degenerate with $H(\mu) = -\sum_{g \in G} \mu(g) \log \mu(g) < \infty$.

The asymptotic entropy of (G, μ) is defined as

$$h(\mu) := \lim_{n \to \infty} \frac{H(\mu^{*n})}{n}.$$

The entropy criterion [Avez '72, Derriennic '81, Kaimanovich-Vershik '83]

The Poisson boundary of (G, μ) is non-trivial $\iff h(\mu) > 0$.

Question: Fix G and consider $\mu, \{\mu_k\}_{k \geq 1} \in \mathrm{Prob}(G)$ with finite entropy such that:

- $\lim_{k \to \infty} \mu_k(g) = \mu(g)$ for each $g \in G$ and
- $\lim_{k \to \infty} H(\mu_k) = H(\mu)$.

Is it true that $\lim_{k \to \infty} h(\mu_k) = h(\mu)$?

Example: $\mathbb{Z}/2\mathbb{Z} \wr D_\infty$**, where** $D_\infty = \mathbb{Z}/2\mathbb{Z} * \mathbb{Z}/2\mathbb{Z}$

- Gilch '08: any non-degenerate finitely supported prob. measure on D_∞ is recurrent.
- D_∞ has $\mathbb{Z}$ as a finite index subgroup (that admits finitely supported transient probability measures).
- There are μ, $\{\mu_k\}_{k \geq 1} \in \mathrm{Prob}(\mathbb{Z}/2\mathbb{Z} \wr D_\infty)$ finitely supported such that $h(\mu) > 0$ and $h(\mu_k) = 0$ for all $k \geq 1$, with $\mu_k \xrightarrow[k\to\infty]{} \mu$.

Theorem [S. '25]

Let B be a virtually nilpotent group of at least cubic growth (e.g. $B = \mathbb{Z}^d$, $d \geq 3$). For any non-degenerate probability measures $\mu, \{\mu_k\}_{k \geq 1}$ on $\mathbb{Z}/2\mathbb{Z} \wr B$ such that

- $\mu_k(g) \xrightarrow[k \to \infty]{} \mu(g)$ for all $g \in \mathbb{Z}/2\mathbb{Z} \wr B$ and
- $H(\mu_k) \xrightarrow[k \to \infty]{} H(\mu)$

we have $h(\mu_k) \xrightarrow[k \to \infty]{} h(\mu)$.

Theorem [S. '25]

Let B be a virtually nilpotent group of at least cubic growth (e.g. $B = \mathbb{Z}^d$, $d \geq 3$). For any non-degenerate probability measures $\mu, \{\mu_k\}_{k \geq 1}$ on $\mathbb{Z}/2\mathbb{Z} \wr B$ such that

- $\mu_k(g) \xrightarrow[k \to \infty]{} \mu(g)$ for all $g \in \mathbb{Z}/2\mathbb{Z} \wr B$ and
- $H(\mu_k) \xrightarrow[k \to \infty]{} H(\mu)$

we have $h(\mu_k) \xrightarrow[k \to \infty]{} h(\mu)$.

Intuition: Entropy at time n on $\mathbb{Z}/2\mathbb{Z} \wr B \longleftrightarrow$ number of distinct points visited by the projection to the base B up to time n.

Definition

Let μ be a prob. measure on a countable group G. Denote by $(X_n)_{n \geq 0}$ the μ-random walk on G. We define the escape probability

$$p_{\text{esc}}(\mu) := \mathbb{P}(X_n \neq e_G \text{ for all } n \geq 1).$$

It holds almost surely that $\displaystyle\lim_{n \to \infty} \frac{\#|\{X_0, X_1, \ldots, X_n\}|}{n} = p_{\text{esc}}(\mu).$

Continuity of escape probability

Definition

Let μ be a prob. measure on a countable group G. Denote by $(X_n)_{n \geq 0}$ the μ-random walk on G. We define the escape probability

$$p_{\text{esc}}(\mu) := \mathbb{P}(X_n \neq e_G \text{ for all } n \geq 1).$$

It holds almost surely that $\lim\limits_{n \to \infty} \dfrac{\#|\{X_0, X_1, \ldots, X_n\}|}{n} = p_{\text{esc}}(\mu)$.

Theorem [S. '25]

Let G be a group of at least cubic growth (e.g. $G = \mathbb{Z}^d$, $d \geq 3$). For any non-degenerate probability measures $\mu, \{\mu_k\}_{k \geq 1}$ on G such that $\mu_k(g) \xrightarrow[k \to \infty]{} \mu(g)$ for all $g \in G$ we have $p_{\text{esc}}(\mu_k) \xrightarrow[k \to \infty]{} p_{\text{esc}}(\mu)$.

Uses (a uniform version of) a comparison lemma of heat kernels of symmetric and non-symmetric Markov operators due to Coulhon and Saloff-Coste (late 80's).

Theorem [S. '25]

Let G be a countable group and consider non-degenerate prob. measures $\mu, \{\mu_k\}_{k \geq 1}$ on G with finite entropy and such that $\mu_k \xrightarrow[k \to \infty]{} \mu$.

Suppose that there is a Polish space X such that

- there are prob. measures ν (resp. ν_k) on X such that (X, ν) (resp. (X, ν_k)) is the Poisson boundary of (G, μ) (resp. (G, μ_k)).

If $\nu_k \xrightarrow[k \to \infty]{} \nu$ weakly, then $h(\mu_k) \xrightarrow[k \to \infty]{} h(\mu)$.

Theorem [S. '25]

Let G be a countable group and consider non-degenerate prob. measures μ, $\{\mu_k\}_{k\geq 1}$ on G with finite entropy and such that $\mu_k \xrightarrow[k\to\infty]{} \mu$. Suppose that there is a Polish space X such that

- there are prob. measures ν (resp. ν_k) on X such that (X, ν) (resp. (X, ν_k)) is the Poisson boundary of (G, μ) (resp. (G, μ_k)).

If $\nu_k \xrightarrow[k\to\infty]{} \nu$ weakly, then $h(\mu_k) \xrightarrow[k\to\infty]{} h(\mu)$.

Starting point: Kaimanovich-Vershik '83:

$$h(\mu) = -\sum_{g\in G} \mu(g) \int_X \log\left(\frac{dg_*^{-1}\nu}{d\nu}(\xi)\right) d\nu(\xi).$$

Theorem [S. '25]

Let G be a countable group and consider non-degenerate prob. measures μ, $\{\mu_k\}_{k \geq 1}$ on G with finite entropy and such that $\mu_k \xrightarrow[k \to \infty]{} \mu$. Suppose that there is a Polish space X such that

- there are prob. measures ν (resp. ν_k) on X such that (X, ν) (resp. (X, ν_k)) is the Poisson boundary of (G, μ) (resp. (G, μ_k)).

If $\nu_k \xrightarrow[k \to \infty]{} \nu$ weakly, then $h(\mu_k) \xrightarrow[k \to \infty]{} h(\mu)$.

If X is furthermore compact and admits a unique μ-stationary prob. measure, then the weak convergence $\nu_k \xrightarrow[k \to \infty]{} \nu$ always holds.

Applications:

- ► Hyperbolic groups (Previously proved with different methods by Erschler-Kaimanovich '13, Gouëzel-Mathéus-Maucourant '18, Choi '24).
- ► Acylindrically hyperbolic groups [Choi '24] (e.g. mapping class groups, $\mathrm{Out}(F_n)$, etc...)
- ► $\mathrm{SL}_d(\mathbb{Z})$ for $d \geq 3$.
- ► Many groups acting on $\mathrm{CAT}(0)$-spaces.
